

# A ALE Finite Element Method for Vorticity-Streamfunction Formulation with Species Transport Equation

Student Researcher: Leandro Marques

Advisors: Gustavo Anjos and Jose Pontes

State University of Rio de Janeiro

June, 22th 2020

# Outline

1. Introduction
2. Mathematical Model
3. Validation
4. Results
5. Conclusion

# Introduction

## Motivation:

- Ischaemic heart disease and stroke have remained the leading death causes globally in the last 15 years [1]

## Aims:

- To develop a Finite Element code for stream-vorticity formulation with species transport equation using the Arbitrary Lagrangian-Eulerian (ALE) approach
- To create new drug-eluting design patent

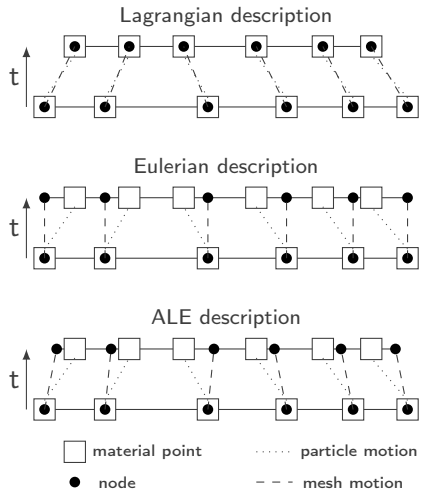

1. Introduction
2. Mathematical Model
3. Validation
4. Results
5. Conclusion

## REWRITE

In ALE description, the referential frame moves with an arbitrary velocity that does not necessarily represent the Lagrangian or Eulerian description.

The convection velocity is calculated by the relative velocity between the material and the mesh velocity respectively [2]

# Governing Equations

Assumptions [4]:

1. Continuum hypothesis
2. Homogeneous and Isotropic
3. Incompressible
4. Newtonian
5. Constant Mass Difusivity
6. Single-phase Flow
7. Two-dimensional flow

$$\frac{D\omega}{Dt} = \frac{1}{Re} \nabla^2 \omega$$

$$\nabla^2 \psi = -\omega$$

$$\frac{Dc}{Dt} = \frac{1}{ReSc} \nabla^2 c$$

where,  $D(\cdot)/Dt$  is substantive derivative and the material velocity field is calculated by:  $v_x = \partial\psi/\partial y$  and  $v_y = -\partial\psi/\partial x$

# Semi-Lagrangian Method

The implicit semi-Lagrangian time discretization provides [3]:

Advantages:

- Symmetric linear systems
- Unconditionnal stability

Disadvantages:

- Numerical Diffusion
- Searching procedure may lead to excessive computational cost if it is not well designed

$$\frac{\omega_i^{n+1} - \omega_d^n}{\Delta t} = \frac{1}{Re} \nabla^2 \omega^{n+1}$$

$$\nabla^2 \psi = -\omega$$

$$\frac{c_i^{n+1} - c_d^n}{\Delta t} = \frac{1}{ReSc} \nabla^2 c^{n+1}$$

$$N_i = L_i$$
$$i = 1, 2, 3$$

$$\left[ \frac{\mathbf{M}}{\Delta t} + \frac{\mathbf{K}}{Re} \right] \omega_i^{n+1} = \frac{\mathbf{M}}{\Delta t} \omega_d^n$$

$$\mathbf{K}\psi = \mathbf{M}\omega$$

$$\left[ \frac{\mathbf{M}}{\Delta t} + \frac{\mathbf{K}}{ReSc} \right] c_i^{n+1} = \frac{\mathbf{M}}{\Delta t} c_d^n$$

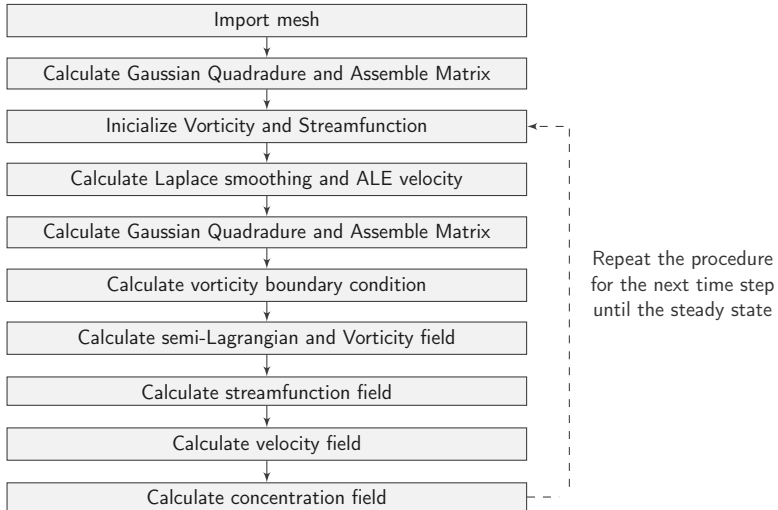

The material velocity field is calculated by:  $\mathbf{M}v_x = \mathbf{G}_y\psi$  and  $\mathbf{M}v_y = -\mathbf{G}_x\psi$

# Adaptive Mesh Refinement

Mesh smoothing description and comparative figures

# Solution Algorithm

1. Introduction
2. Mathematical Model
3. Validation
4. Results
5. Conclusion

# Validation - Poiseuille Flow

Boundaries Conditions:

Inflow condition:  $u = 1, v = 0$  e  $\psi = y$

Outflow condition:  $\psi = y$

Top plate:  $u = 0, v = 0, \psi = 1$

Bottom plate:  $u = 0, v = 0, \psi = 0$

(a)

(b)

(a) comparison of Poiseuille Flow velocity profile and

(b) log scale graph of convergence order.

# Validation - Lid Driven Cavity Flow

Boundaries Conditions:

Bottom and side plates:  $u = 0$ ,  $v = 0$  e  $\psi = 0$

Top plate:  $u = 1$ ,  $v = 0$  e  $\psi = 0$

Centerline velocity profile in a lid-driven cavity for  $Re = 100$ :  
(a) u-velocity and (b) v-velocity.

Coming Soon

1. Introduction
2. Mathematical Model
3. Validation
4. Results
5. Conclusion

1. Was observed that the species transport in blood flow is directly influenced by drug used in stent production
2. The streamfunction-vorticity formulation showed an useful approach for to calculate the velocity and concentration fields since the variables are scalars allowing a smooth implementation
3. Due to generalized construction of the code, the simulator is able to describe drug-eluting stent problem in coronary artery as well as flows of Newtonian fluids with scalar transport (concentration or temperature)
