- 3. Validation
- 4. Results
- 5. Conclusion

Introduction

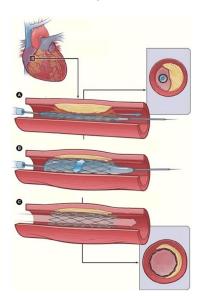

Motivation:

► Ischaemic heart disease and stroke have remained the leading death causes globally in the last 15 years [1]

Aims:

- ► To develop a Finite Element code for stream-vorticity formulation with species transport equation using the Arbitrary Lagrangian-Eulerian (ALE) approach
- ► To create new drug-eluting design patent

- 1. Introduction
- 2. Mathematical Model
- 3. Validation
- 4. Results
- 5. Conclusion

Arbitrary Lagrangian-Eulerian (ALE)

The Arbitrary Lagrangian-Eulerian combines the classical motion descriptions, while it provides [2]:

Lagrangian description

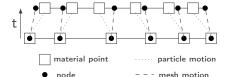

Advantages:

► Simulations in fluid-structure and moving boundary problems

Eulerian description

Disadvantages:

► The computational mesh requires an extensive topological treatment

node

ALE description

[2] Donea, J., Huerta, A., Ponthot, J.-P. and Rodríguez-Ferran, A. (2004). Arbitrary Lagrangian–Eulerian Methods. In Encyclopedia of Computational Mechanics doi:10.1002/0470091355.ecm009

Governing Equations

Assumptions [3]:

- 1. Continuum hypothesis
- 2. Homogeneous and Isotropic
- 3. Incompressible
- 4. Newtonian
- 5. Constant Mass Difusivity
- 6. Single-phase Flow
- 7. Two-dimensional flow

$$\frac{\partial \omega}{\partial t} + (\mathbf{v} - \hat{\mathbf{v}}) \cdot \nabla \omega = \frac{1}{Re} \nabla^2 \omega$$

$$\nabla^2 \psi = -\omega$$

$$\frac{\partial c}{\partial t} + (\mathbf{v} - \hat{\mathbf{v}}) \cdot \nabla c = \frac{1}{ReSc} \nabla^2 c$$

The material velocity field $\mathbf{v}=(v_x,v_y)$ is calculated by: $v_x=\partial\psi/\partial y$ and $v_y=-\partial\psi/\partial x$

The mesh velocity field $\mathbf{\hat{v}} \neq \mathbf{v}$ (Lagrangian) or 0 (Eulerian)

Semi-Lagrangian Method

The implicit semi-Lagrangian time discretization provides [4]:

Advantages:

- ► Symmetric linear systems
- ► Unconditionnal stability

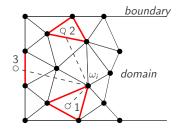

Disadvantages:

- ► Numerical Diffusion
- Searching procedure may lead to excessive computational cost if it is not well designed

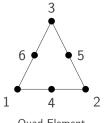

$$\nabla^2 \psi = -\omega$$

$$\frac{c_i^{n+1} - c_d^n}{\Delta t} = \frac{1}{ReSc} \nabla^2 c^{n+1}$$

Galerkin FE Method

$$\left[\frac{\mathsf{M}}{\Delta t} + \frac{\mathsf{K}}{Re}\right] \omega_i^{n+1} = \frac{\mathsf{M}}{\Delta t} \omega_d^n$$

$$\mathbf{K}\psi = \mathbf{M}\omega$$

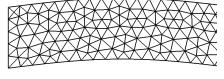

$$\left[\frac{\mathsf{M}}{\Delta t} + \frac{\mathsf{K}}{ReSc}\right] c_i^{n+1} = \frac{\mathsf{M}}{\Delta t} c_d^n$$

The material velocity field is calculated by: $\mathbf{M}v_{\mathbf{x}}=\mathbf{G}_{\mathbf{y}}\psi$ and $\mathbf{M}v_{\mathbf{y}}=-\mathbf{G}_{\mathbf{x}}\psi$

Laplacian Smoothing

To avoid the fast degradation of the computational elements due to ALE description, it was used the Laplacian Smoothing Method [5]

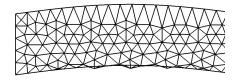

with Laplacian Smoothing

The new node position x_i can be approximated by:

$$\mathbf{\hat{x}_i} = \sum_{i \in N_1} e_{ij}^{-1} (\mathbf{x}_j - \mathbf{x}_i)$$

where, e_{ij}^{-1} is the distance between the node and each neighbor in 1-ring N_1

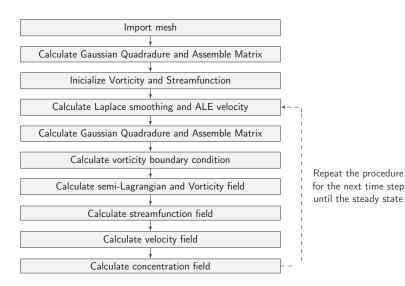

no Laplacian Smoothing

Solution Algorithm

- 1. Introduction
- 2. Mathematical Model
- 3. Validation
- 4. Results
- 5. Conclusion

Validation - Poiseuille Flow

Boundaries Conditions:

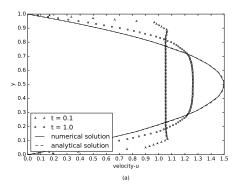

Inflow condition: u = 1, v = 0 e $\psi = y$

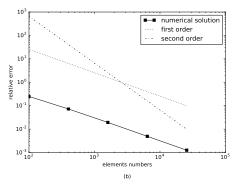

Outflow condition: $\psi = y$

Top plate: u= 0, v= 0, $\psi=$ 1

Bottom plate: u= 0, v= 0, $\psi=$ 0

(a) comparison of Poiseuille Flow velocity profile and (b) log scale graph of convergence order.

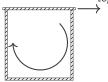

Validation - Lid Driven Cavity Flow

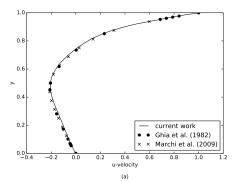

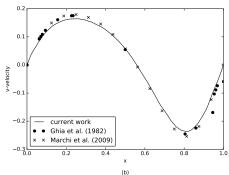

Boundaries Conditions:

Bottom and side plates: u= 0, v= 0 e $\psi=$ 0

Top plate: u=1, v=0 e $\psi=0$

Centerline velocity profile in a lid-driven cavity for Re = 100: (a) u-velocity and (b) v-velocity.

- 4. Results
- 5. Conclusion

Conclusion

- 1. Was observed that the species transport in blood flow is directly influenced by drug used in stent production
- 2. The streamfunction-vorticity formulation showed an useful approach for to calculate the velocity and concentration fields since the variables are scalars allowing a smooth implementation
- 3. Due to generalized construction of the code, the simulator is able to describe drug-eluting stent problem in coronary artery as well as flows of Newtonian fluids with scalar transport (concentration or temperature)
